

1. 安装

apt-get install python-pip

pip install git+https://github.com/shadowsocks/shadowsocks.git@master

2. 配置 /etc/shadowsocks.json

```
{  
    "server": "服务器 IP 或是域名",  
    "server_port": 端口号,  
    "local_address": "127.0.0.1",  
    "local_port": 1080,  
    "password": "密码",  
    "timeout": 300,  
    "method": "加密方式 (chacha20-ietf-poly1305 / aes-256-cfb)",  
    "fast_open": false  
}
```

3. 启动

/usr/local/bin/sslocal -c /etc/shadowsocks.json -d start

4. 关闭

/usr/local/bin/sslocal -c /etc/shadowsocks.json -d stop

5. 开机自启

创建文件 /etc/systemd/system/shadowsocks.service

[Unit]

Description=Shadowsocks Client Service

After=network.target

After=network-online.target

[Service]

#Type=simple

Type=forking

User=root

ExecStart=/usr/local/bin/sslocal -c /etc/shadowsocks.json -d start

[Install]

WantedBy=multi-user.target

配置生效

systemctl enable /etc/system/system/shadowsocks.service
